

Peace-of-mind package for sensitive company data shared internally and externally

SEPPmail agrees technology partnership with eperi

Munich/Pfungstadt, Germany. 26 September 2019 – The new agreement with eperi GmbH gives SEPPmail an experienced partner specialized in cloud data protection solutions. The collaboration enables SEPPmail to offer customers data encryption, even in cloud-based applications like Office 365 and Salesforce as well as on cloud platforms like Amazon. The company's customers will now be able to secure all communications processes end to end – both internally and externally.

There are regular headlines in the media about attacks on personal and sensitive information, such as patents and financial details. The good news is that the GDPR has helped to increase people's awareness of data protection. However, there has been a distinct lack of concrete of securing a company's entire communication processes. This requires a comprehensive encryption solution that blocks unauthorized people from accessing legible data. And this is the foundation of the partnership between SEPPmail und eperi. Customers of both providers will now be able to benefit from an integrated security solution that protects data throughout the whole processing chain.

The yin and yang of encryption

The combination of SEPPmail's Secure E-Mail Gateway and eperi's cloud data protection solution delivers end-to-end security. Customers can share sensitive content by email with external partners or recipients inside the firewall and also send content to the cloud – in all cases, the data is protected. In the case of emails, the solution adds a digital signature too.

The eperi solution works internally. With its encryption, data sent to the cloud or Exchange is rendered illegible and worthless to cybercriminals. However, users still benefit from key cloud functions, such as searching and sorting. In contrast, SEPPmail is specialized in securing email-based information flows and uses email signatures and encryption for data security during transmission. In this way, the two providers' solutions complement each other perfectly and deliver both internal and external security.

“We’re pleased we have eperi as a new partner and that we’ll be able to offer customers even more extensive data protection,” says Günter Esch, Managing Director of SEPPmail Germany GmbH. “Our two approaches complement each other like yin and yang. Companies can implement our combined offering quickly and with little effort – and there’s hardly any change to the end user’s way of working.”

“Together, we can offer our customers end-to-end security while still allowing them to benefit from cloud advantages like searching and sorting,” adds eperi’s CEO Elmar Eperiesi-Beck. “Email content and file attachments are encrypted all the time and useless to attackers – even if the data is stored with a cloud provider. I’m pleased about this partnership and the fact that we can now offer customers an even more integrated encryption solution.
